IN THE CLAIMS

- 1. (currently amended) An apparatus for managing a state of an external apparatus connected thereto, comprising:
 - a database storing the state of the external apparatus;
- a managed object (MO) managing the state of the external apparatus, the MO being provided in said database and realized by an application, the MO having a table storing information on the state of the external apparatus and a stored procedure defining a method related to the table; and
- a control interface through which for said MO performs performing outer control of the external apparatus from said database, the interface being provided in said MO.
- 2. (original) The apparatus as claimed in claim 1, further comprising a result notification interface for notifying said database of a result of the outer control performed by said MO with the result being correlated with the control, the result notification interface being provided in said MO.
- 3. (original) The apparatus as claimed in claim 1, further comprising a change notification interface for notifying said MO of a change in the state of the external apparatus, the change notification interface being provided in said MO.

{

- 4. (original) The apparatus as claimed in claim 1, further comprising a protocol conversion part converting a first protocol into a second protocol for transmitting information between said database and the external apparatus.
- 5. (original) The apparatus as claimed in claim 4, wherein said database and said protocol conversion part comprise a server computer managing the external apparatus.
- 6. (original) The apparatus as claimed in claim 5, wherein said MO performs outer control or a notification is transmitted to said MO from outside before said database completes transaction processing requested by a user application connected to the apparatus.
- 7. (original) The apparatus as claimed in claim 6, further comprising an event notification interface for notifying the user application of an event, the event notification interface being provided in said MO.
- 8. (original) The apparatus as claimed in claim 6, wherein an operation statement for operating said MO is provided in a query language for posing a query to said database from the user application.
- 9. (original) The apparatus as claimed in claim 6, wherein said MO is operated by using a reference statement of a query language for posing a query to said database from the user application.

- 10. (original) The apparatus as claimed in claim 1, wherein said control interface is provided with a function of extending transaction processing in said database.
- 11. (original) The apparatus as claimed in claim 1, wherein control of establishing a session with said database is extended so that operations of a plurality of users are performed as one transaction.
- 12. (currently amended) A method of managing a state of an apparatus, the method realizing a managed object (MO) by an application and storing the state of the apparatus in a database, the MO managing the state of the apparatus,

wherein the MO is provided inside the database so as to have a table storing information on the state of the apparatus and a stored procedure defining a method related to the table, and performs outer control of the apparatus therefrom via a control interface.

- 13. (original) The method as claimed in claim 12, wherein said database is notified of a result of the outer control via a result notification interface provided in the MO with the result being correlated with the control.
- 14. (original) The method as claimed in claim 12, wherein the MO is notified of a change in the state of the apparatus provided external to the database via a change notification interface provided in the MO.

- 15. (original) The method as claimed in claim 12, wherein a protocol conversion part converts a first protocol into a second protocol for transmitting information between the database and the apparatus.
- 16. (original) The method as claimed in claim 15, wherein a server computer comprising the database and the protocol conversion part manages the apparatus connected to the server computer.
- 17. (original) The method as claimed in claim 16, wherein the MO performs outer control or a notification is transmitted to the MO from outside before the database completes transaction processing requested by a user application connected to the server computer.
- 18. (original) The method as claimed in claim 17, wherein the user application is notified of an event via an event notification interface provided in the MO.
- 19. (original) The method as claimed in claim 17, wherein an operation statement for operating the MO is provided in a query language for posing a query to the database from said user application.
- 20. (original) The method as claimed in claim 17, wherein the MO is operated by using a reference statement of a query language for posing a query to the database from the user application.

- 21. (original) The method as claimed in claim 12, wherein the control interface is provided with a function of extending transaction processing in the database.
- 22. (original) The method as claimed in claim 12, wherein control of establishing a session with the database is extended so that operations of a plurality of users are performed as one transaction.
